

Technical Appendix

Toward Measurement for a Whole Child Health Policy: Validity and National and State Prevalence of the Integrated Child Risk Index

Christina Bethell, PhD, MBA, MPH, Courtney K. Blackwell, PhD, Narangerel Gombojav, MD, PhD, Martha B. Davis, MSS, Charles Bruner, PhD, Andrew Garner, MD, PhD

NOTE: References noted are the same as included in the main paper and numbered the same as well. See the main paper for specific references.

Table of Contents

Appendix A: Methods Notes and Description of Key Study Variables

Part A1: Details about the 2016, 2017 and 2018 National Survey of Children's Health (NSCH) (3 years combined) sample size and response rate

Part A2: Details about missing values for study variables in the 2016, 2017 and 2018 NSCH

Part A3: Measurement details for Integrated Child Risk Index criteria measures (with references)

Part A4: Correlations across the twelve Integrated Child Risk Index (ICRI) criteria

Part A5: Measurement details for study ICRI validation outcome measures

Appendix B: Mapping of the Integrated Child Risk Index risk criteria measures to standardized social determinants of health measurement instruments being used in the field

Part B1: A conceptual crosswalk between the Integrated Child Risk Index and the Accountable Health Communities (AHC) Health-Related Social Needs (HRSN) Screening Tool

Part B2: A conceptual crosswalk between the Integrated Child Risk Index social health risk and relational health risk criteria to prominent measures of social determinants of health used in the field today

Appendix C: Additional findings regarding analysis of associations across ICRI domains

Part C1: Associations between children experiencing each study outcome (emergency room visits, forgone health care, child flourishing, school engagement/ready to engage in school) and their Integrated Child Risk Index (ICRI) individual medical, social and relational health risk domain component scores

Part C2: National and across-state prevalence of children experiencing Integrated Child Risk Index (ICRI) criteria for each ICRI scoring options, individual domains (medical, social and/or relational health risk) and by each ICRI risk criteria: by child's age, sex and income

Part C3: National and across-state prevalence of children experiencing Integrated Child Risk Index (ICRI) criteria for each of the three ICRI domains (medical, social and/or relational health risk) and by each ICRI risk criteria: by child's insurance status/type and race/ethnicity

Part C4: Logistic regression analysis details (associated with Figure 2) **Dependent variable:** Children age 0-17 who experienced 1 or more ICRI Medical Health Risks, all children and stratified by Relational Health Risk criteria count. **Key independent variable:** ICRI Domain: Social Health Risk criteria count

Appendix D: Additional findings on convergent and divergent validity analyses

Part D1: Prevalence of US children who experienced Integrated Child Risk Index criteria by child responses to each study validation outcome measure

Part D2: Prevalence of study validation outcomes (emergency room visits, forgone health care, child flourishing, school engagement/ready to engage in school) by child's age, sex, race/ethnicity, household income and insurance status/type

Part D3: Logistic regression analysis details for four outcome measures. **Key independent variable:** Scoring Option 1. Domain Count: Number of ICRI domains experienced

Part D4: Logistic regression analysis details for four outcome measures. **Key independent variable:** Scoring Option 2. Domain Combination: Mutually exclusive combinations

Part D5: Logistic regression analysis details for four outcome measures. **Key independent variable:** Scoring Option 3. Cumulative Risk: Number of ICRI criteria experienced

Part D6: Logistic regression analysis details for four outcome measures. **Key independent variable:** ICRI Component: Medical Health Risk criteria count

Part D7: Logistic regression analysis details for four outcome measures. **Key independent variable:** ICRI Component: Social Health Risk criteria count

Part D8: Logistic regression analysis details for four outcome measures. **Key independent variable:** ICRI Component: Relational Health Risk criteria count

Part D9: Logistic regression analysis details for four outcome measures. **Key independent variable:** ICRI Components: Medical Health Risk, Social Health Risk and Relational Health Risk criteria counts (adjusted for other domains)

Appendix E: Additional findings on the national and state prevalence of US children meeting Integrated Child Risk Index criteria

Part E1: Distribution of US children for each Integrated Child Risk Index scoring option by child characteristics (prevalence of ICRI by characteristics is in Table 2 and 3 in the main paper. This shows prevalence of child characteristics by ICRI scoring option).

Part E2: Table showing state by state prevalence of children age 0-17 experiencing two or more ICRI domains for (1) all children and (2) for children living in households with incomes that are below 200% of the Federal Poverty Level (FPL).

Part E3: US map showing state by state prevalence of all children age 0-17 years experiencing risks on two or more of the three Integrated Child Risk Index (ICRI) domains

Part E4: Table comparing NSCH 2016-2018 versus NSCH 2019 prevalence on the ICRI (domain count and domain combination scoring options), by the three ICRI domains and by specific ICRI risk criteria measures: by age and insurance type

Appendix A: Methods Notes

Part A1: Details about the 2016, 2017, 2018 National Survey of Children’s Health (NSCH) (3 years combined) sample size and response rate

The 2016, 2017 and 2018 NSCH used address-based sampling and was self-administered (paper or online) by the parent or guardian of a randomly selected child in a sampled household.^{41,42} Between July 2016 and February 2017, the 2016 NSCH sampled 364,150 households, resulting in 50,212 completed questionnaires for children ages 0-17. Here “caregiver” refers to a child’s parent or guardian. Between August 2017 and February 2018, the 2017 NSCH sampled 156,675 households, resulting in 21,599 completed questionnaires. Between June 2018 and January 2019, the 2018 NSCH sampled 176,052 households, resulting in 30,530 completed questionnaires for children ages 0-17. Combined, the 2016-2018 NSCH data includes 102,341 completed questionnaires. The combined 2016-2017 NSCH data includes 71,811 completed questionnaires.

For the 2016 NSCH, the weighted response rate was 40.7% and the interview completion rate, defined as the probability that a household initiating the survey will complete it, was 69.7%. For the 2017 NSCH, the weighted response rate was 37.4%, and the interview completion rate was 70.9%. For the 2018 NSCH, the weighted response rate was 43.1%, and the interview completion rate was 78.0%. For more information on the 2016, 2017 and 2018 NSCH methodology, visit the CAHMI’s Data Resource Center website: <https://www.childhealthdata.org/learn-about-the-nsch/methods>.

Part A2: Details about missing values for study variables in the 2016, 2017 and 2018 NSCH

For this analysis, missing values were counted when responses were missing to survey questions that were meant to be answered. Missing values were not counted if responses were missing because a respondent appropriately skipped a question or because a respondent exited the survey before viewing a question. Table one shows the missing value rates across study outcome variables and each of the 12 Integrated Child Risk Index items/measures are included in Table A1. Missing value rates from a low of 0% to 2.8% for the “treated or judged unfairly due to race or ethnicity.” Additional analyses were conducted to evaluate differences in ICRI item/measure prevalence between children with or without responses to this item. Results are available upon request and are not shown here since 2.8% is within the acceptable range of missing values using standards in the field.

Table A1: Missing values across outcome variables and Integrated Child Risk Index items.

	Missing values from the 2016, 2017 and 2018 NSCH (3 years combined)		Missing values from the 2016- 2017 (2 years combined)	
	n	Unweighted %	n	Unweighted %
Child Demographics, Insurance Status/Type				
Age	0	0%	0	0%
Sex (imputed)	0	0%	0	0%
Race (imputed)	0	0%	0	0%
Household poverty level (FPL) (imputed)	0	0%	0	0%

Adverse Childhood Experiences (ACEs) – 6 ACEs items				
Adverse Childhood Experiences (ACEs) – 6 ACEs items	2293	2.2%	1597	2.2%
Parental aggravation	929	0.9%	642	0.9%
Caregiver mental health	1949	1.9%	1372	1.9%
Parental coping/ emotional support	722	0.7%	492	0.7%

Part A3: Measurement details for Integrated Child Risk Index risk criteria measures (with references)

Medical Health Risk (MHR)	
<p>The Medical Health Risk domain of the Integrated Child Risk Index assesses medical health risks that have been associated in prior studies with greater likelihood of having needs for complex health and related services, poorer physical, mental and educational outcomes. The criteria included the medical health risk domain assess medical complexity risks beyond diagnoses in order to more accurately assess health risks that have implications for outcomes as well as health care utilization.</p>	
<p>Children with More Complex Special Health Care Needs: Child met “more complex” CSHCN Screener criteria</p>	<p>Using the validated Children with Special Health Care Needs (CSHCN) Screener, children are classified as having an ongoing condition requiring more than routine health services.^{42,56} The 5-item CSHCN Screener identifies children with special health needs based on the definition provided by the federal Maternal and Child Health Bureau (MCHB). CSHCN experience “more complex health care needs” if they qualify on one or more of the four screening criteria addressing elevated need or use of specialized services, therapies, or functional limitations. Children in this group may need or use prescription medications, but also meet one of the four other CSHCN Screener criteria. CSHCN with “less complex” needs experience chronic health conditions that are managed primarily through prescription medication.</p>
<p>Multiple Chronic Conditions: Child had two or more chronic or lifelong condition diagnoses</p>	<p>Having two or more of the chronic or life-long conditions was assessed by whether children had two or more of the following conditions included in the NSCH. Chronic allergies (including food, drug, insect or other), arthritis, asthma, blood disorders (such as sickle cell disease, thalassemia, or hemophilia), brain injury, concussion or head injury, cerebral palsy, cystic fibrosis, diabetes, Down Syndrome, epilepsy or seizure disorder, genetic or inherited condition, heart condition, frequent or severe headaches including migraine, Tourette Syndrome, anxiety problems, depression, behavioral or conduct problems, substance abuse disorder, developmental delay, intellectual disability/mental retardation, speech or other language disorder, learning disability, other mental health condition, Autism or Autism Spectrum Disorder (ASD), or ADD or ADHD.^{42,56,57}</p>
<p>Functional Difficulties: Child had one or more of eleven frequent, chronic and/or serious functional difficulties</p>	<p>Children experience “one or more of eleven frequent, chronic and/or serious functional difficulties” if their caregiver reported on any one or more of the following eleven functional difficulties with: “breathing or other respiratory problems,” “eating or swallowing,” “digesting food,” “repeated or chronic physical pain, including headaches,” “using hands (age 0-5 years),” “coordinating or moving around (age 0-5 years),” “serious difficulty concentrating, remembering, or making decisions (age 6-17 years),” “serious difficulty walking or climbing stairs (age 6-17 years),” “difficulty doing errands along (age 12-17 years),” “hearing problems,” “vision problems.” These functional difficulties correlate with the International Classification of Functioning, Disability and Health: Children and Youth version (ICF-CY).⁵⁸ Nearly all children meeting CSHCN Screener criteria also experience functional difficulties.⁵⁶ Yet, some children not meeting the “more complex” CSHCN Screener criteria may still have substantial functional difficulties so this is maintained in the ICRI. In addition, the detail on functional difficulties can be valuable for clinical and program decisions.^{56,57}</p>

<p>Overall Health Status: Child had poor/fair overall health status</p>	<p>Children we categorized as having “fair or poor health status” based on caregiver report to a single item on overall health status.⁵⁹ Due to the high positivity bias in parent response to this question, a very low prevalence of children in the US are expected to qualify as “fair or poor” overall health. One scale of “Excellent, Very Good, Good, Fair, Poor”, typically responses of “good, fair or poor” indicate child health problems.⁵⁹</p>
<p>Social Health Risk (SHR)</p>	
<p>The Social Health Risk domain assesses social risks that have been previously associated with physical, mental and educational outcomes. The criteria included in the Social Health Risk domain align with prominent models of social determinants of health^{64,65}and particularly requiring a societal/community response.</p>	
<p>Food Insecurity: Sometimes or often could not afford enough to eat</p>	<p>Children experience food insecurity if caregiver reported “sometimes we could not afford enough to eat” or “often we could not afford enough to eat” to the item: “Which of these statements best describes your household’s ability to afford the food you need DURING THE PAST 12 MONTHS?”^{10,11,42}</p>
<p>Economic Hardship: Somewhat often/ very often hard to cover costs of basic needs, like food, housing</p>	<p>The NSCH item for economic hardship in the 2016 and 2017 NSCH, was, “since this child was born, how often has it been very hard to get by on your family’s income – hard to cover the basics like food or housing?” In 2018, the NSCH item was “since this child was born, how often has it been very hard to cover the basics, like food and housing, on your family’s income?” Response options remained the same throughout all 2016, 2017 and 2018 NSCH. Also note that the “economic hardship” item included in the ICRI is not the same as poverty. Nearly 70% (68.8%) of children whose caregiver reported “economic hardship” have household incomes less than 200% of the FPL. 36.8% reporting “economic hardship” report poverty level income (0-99% FPL). This means that over 30% reporting economic hardship (31.2%) have incomes greater than 200% FPL and 7.7% have incomes 400% or above FPL.^{29,30,42}</p>
<p>Neighborhood Safety/Violence: Lived in an unsafe neighborhood or where the child was a victim of or witnessed violence</p>	<p>Children experience this risk if caregiver reported “somewhat or definitely disagree” to item: “Does this child live in a safe neighborhood?” or if caregiver reported child has ever been a “victim of violence or witnessed violence in neighborhood.”^{13,39,42}</p>
<p>Disadvantaged Due to Racism: Child has been treated or judged unfairly due to their race/ethnic group</p>	<p>Children experience this risk if caregiver reported child has “ever experienced the following: treated or judged unfairly because of his or her race or ethnic group.” This item refers to specific instances where caregivers have witnessed child treated unfairly due to race/ethnicity, beyond systemic racism or microaggressions.^{14,31,42} While prevalence is low, it is significantly higher for black, non-Hispanic children (10%) than for Hispanic (4.3%) and white (1.2%) children. This item has been validated and is continually included in the NSCH. For more details, visit the CAHMI’s Data Resource Center: www.childhealthdata.org.</p>
<p>Relational Health Risk (RHR)</p>	
<p>The Relational Health Risk domain includes criteria from research-based models of social determinants of health that specifically assess risks to the safety, stability and nurturing qualities of the relationships children experience in the household/family. These items differ from the Social Health Risk domain in that they require individual and family level and often also at the societal/community level interventions.¹⁻⁴</p>	
<p>Multiple Adverse Childhood Experiences (ACEs): Exposed to two or more household level ACEs</p>	<p>Children experience this risk if caregiver reported at least two categories of exposure to adverse childhood experiences (ACEs) based on the ACEs indicator included in the National Survey of Children’s Health (NSCH).⁶⁰ Topics included here are: parent/guardian divorced or separated; parent/guardian died; parent/guardian served time in jail; child saw or heard</p>

	physical violence in the home; child lived with anyone who was mentally ill, suicidal, or severely depressed; child lived with anyone who had a problem with alcohol or drugs. These items align with the CDC Kaiser study ³² on ACEs and relate to household-level adverse experiences, with the exception of parental death which we included as well. ⁶⁰ Research strongly supports ACEs as a risk factor for early and lifelong well-being of children. ^{16,17,19}
Low Parental Mental Health: One or two caregivers reported poor or fair mental health	Children experience this risk if caregiver reported having “fair or poor” to the item: “what is the status of mother’s/father’s mental and emotional health, in general?” ^{35,42,54}
High Parental Aggravation: Child’s caregiver usually/always felt aggravated with child	Caregivers who “usually or often feel aggravated” are defined as those who reported that during the last month, on average, they “usually or always felt their child was much harder to care for than other children,” or were “usually or always bothered a lot by their child’s behavior,” or “usually or always felt angry with their children.” ^{42,61,62}
Low Parent Coping/Emotional Support: Child’s caregiver is not coping well and/or lacks emotional support for parenting	Children experience this risk if caregiver reported “not very well” or “not very well at all” to item: “how are you coping with day-to-day demands of raising children” or if caregiver reported “no” to item: “do you have someone to turn to for day- to-day emotional support with parenting or raising children.” ^{20,35,63}

Part A4: Correlations across the 12 Integrated Child Risk Index criteria

Pearson’s correlations were calculated across all binomial criteria included in the Integrated Child Risk Index. Pearson’s correlations coefficients ranged from 0.018 to 0.596, with only 5 cases where correlation was greater than 0.30. These findings show that overall ICRI criteria are not highly redundant.

	Children with More Complex Special Health Care Needs	Poor, Fair Overall Health Status	2+ Chronic Conditions	Serious, Frequent, Ongoing Functional Difficulties	Food Insufficiency, Insecurity	Economic Hardship to Meet Basic Needs	Neighborhood Safety/ Exposure to Violence	Treated or Judged Unfairly Due to Race or Ethnicity	2+ Adverse Childhood Experiences	Poor, Fair Caregiver Mental Health	High Aggravation with Parenting	Low Parent Coping/ Emotional Support-

Part A5: Measurement details for study ICRI validation outcome measures

<p>Hospital Emergency Room Utilization</p>	<p>Children are considered to have hospital emergency room utilization if caregiver reported “1 or more hospital emergency room visits for any health reason in the past 12 months.”⁴²</p>
<p>Forgone Health Care</p>	<p>Children are considered to have forgone needed health care if caregiver reported “did not receive needed health care” to item: “during the past 12 months, was there any time when this child needed health care but it was not received?”⁴² While this item has been validated, it is often under-reported due to caregiver bias. Due to this, sample size did not allow for regression analyses using forgone needed health care variable. More information is available at the CAHMI’s Data Resource Center’s website: http://childhealthdata.org/browse/survey?s=2&y=24&r=1</p>
<p>Child Flourishing Index (CFI), age 6 months-17 years</p>	<p>For children 6 months-5 years, this index was constructed based on the number of “definitely true” responses by caregivers to four survey items (possible score of 0-4). Caregivers are asked how well each of the three items describes their child: “bounces back quickly when things don’t go their way,” “are affectionate and tender with parent,” “show interest and curiosity in learning new things,” “smile and laugh a lot.” Those with an index of 4 were classified as flourishing.^{17,42} For children age 6-17 years, this index was constructed based on the number of “definitely true” responses by caregivers to three survey items (possible score 0-3). Caregivers are asked how well each of the three items describes their child: "shows interest and curiosity in learning new things," "works to finish tasks he or she starts," and "stays calm and in control when faced with a challenge." Those children with an index of 3 were classified as flourishing (“definitely true” for all three descriptions). This index has been validated and documented elsewhere.^{17,66}</p>
<p>Ready to Engage in School (3-5 years)</p>	<p>Children age 3-5 years met criteria to be ready to engage in school if their caregivers reported they were “very confident” to the question “how confident are you that this child will be successful in elementary or primary school?” (2016 NSCH) or “completely confident” to the question “how confident are you that this child is ready to be in school?” (2017 and 2018 NSCH).⁴² This item was found to be highly correlated with the robust “Healthy and Ready to Learn” measure derived from 18 individual NSCH survey items. The “Healthy and Ready to Learn” measure considers age-relevant attainment of cognitive skills, as well as social, emotional and physical aspects of a young child’s readiness to learn in school.⁶⁷ For more information, view Child Trend’s report on the Healthy and Ready to Learn Measure: https://www.childtrends.org/wp-content/uploads/2019/08/NOM-FAQ_ChildTrends_Aug2019.pdf</p>
<p>Child School Engagement (6-17 years)</p>	<p>Children met criteria for being engaged in school if their caregiver reported “definitely true” to both of the following items: their child “cares about doing well in school” and “does all required homework.”⁴² This item was combined with the above item “Ready to Engage in School” to create a composite “Engaged/Ready to Engage in School” variable for children ages 3 -17 years.⁴²</p>

Appendix B: Mapping of the Integrated Child Risk Index risk criteria measures to standardized social determinants of health measurement instruments being used in the field

Part B1: A conceptual crosswalk between the Integrated Child Risk Index and the Accountable Health Communities (AHC) Health-Related Social Needs (HRSN) Screening Tool

The mapped by domain to the AHC HRSN Screening Tool domains (13 domains, 26 total items).⁶³ The 12-item ICRI reflected aspects of all domains included in the AHC HRSN except for housing instability, physical activity and education. Items related to housing instability and physical activity (caregiver or child) are not included in the NSCH.

	<i>Integrated Child Risk Index</i> Check mark indicate if each domain contains an item that reflects (R) or contributes to (C) each item in the AHC HRSN.		
<i>Accountable Health Communities (AHC) Health-Related Social Needs (HRSN) Screening Tool from the Centers for Medicare & Medicaid Services (CMS)</i> ⁶³	Medical Health Risk domain	Social Health Risk domain	Relational Health Risk domain

NOTES All percentages are weighted to represent the US child population.

^aData source: 2016-2018 (3 years combined) National Survey of Children's Health; ^bVariations within child subgroups are all statistically significant.

Statistical significance of differences is set at $p < 0.05$ and is based on tests of independence comparing the percentage of children meeting ICRI scoring option

criteria by insurance status/type and race/ethnicity. ^cIncludes children with any public health insurance, even if they also had some form of private insurance

as well; ^dEstimate has a 95% confidence interval width exceeding 30 percentage points or 1.3 times the estimate and may not be reliable. ^eThe adverse

childhood experiences (ACEs) measure used in this study only includes topics aligned with the original CDC/Kaiser study on ACEs: witnessed violence in

home, loss of caregiver due to death, divorce/separation, incarceration, household alcohol or drug abuse or serious depression, suicidality, mental illness.

^fChild had one or two caregivers reporting poor or fair overall mental health status. ^gChild's caregiver reported that they usually/always felt the child is

difficult to care for, does things that bother them, or is angry with child.

Part C4: Logistic regression analysis details (associated with Figure 2 in the main paper). **Dependent variable:** Children age 0-17 who experienced 1 or more ICRI medical health risks, all children and stratified by Relational Health Risk criteria count. **Key independent variable:** ICRI Domain: Social Health Risk criteria count

Uninsured	6.3%	4.5%	6.9%	7.3%	8.5%	4.2%	6.8%	9.0%	4.3%	7.0%	9.6%

NOTES All percentages are weighted to represent the US child population. See Table 3 in the paper for prevalence of ICRI and types of risks by race/ethnicity and insurance status/type. See Technical Appendix C2 for prevalence of ICRI and types of risks by age, sex and income.

^aEstimate has a 95% confidence interval width exceeding 30 percentage points or 1.3 times the estimate and may not be reliable.

^bincludes children with both public and private health insurance.

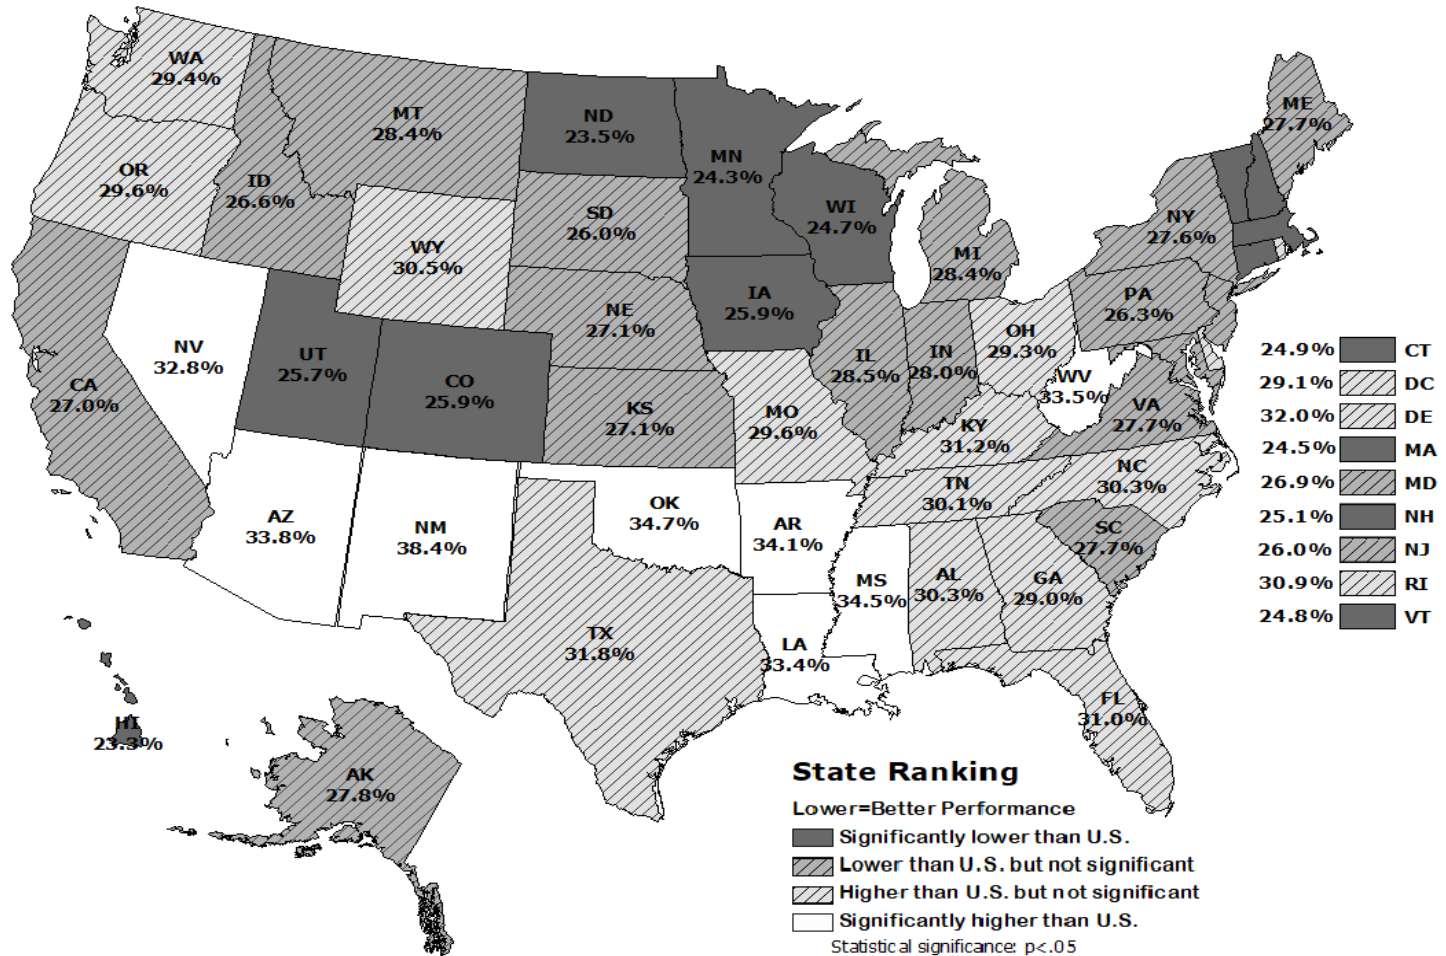

Part E2: Table showing state by state prevalence (and comparison to the nation) of children age 0-17 experiencing two or more ICRI domains for (1) all children and (2) for children living in households with incomes that are below 200% of the Federal Poverty Level (FPL).

ST_NAME	All children	Children living in households with <200% FPL
Nation	28.8%	42.2%

Part E3: US map showing state by state prevalence of all children age 0-17 years experiencing risks on two or more of the three Integrated Child Risk Index (ICRI) domains^a

*Nationwide prevalence of US children experiencing risks on at least two ICRI domains is 28.8%
(State range: 23.3% - 38.4%) Data: National Survey of Children's Health (2016-2018)*

^a Shading indicates results from nested t-tests comparing each state's prevalence to the nation (see legend).

Part E4: Table comparing NSCH 2016-2018 versus NSCH 2019 prevalence on the ICRI (domain count and domain combination scoring options), by the three ICRI domains and by specific ICRI risk criteria measures: by age and insurance type. NOTE: Economic hardship item changed in 2019

	All children, age 0-17 years		Child age						Insurance type			
			0-5	6-11	12-17	0-5	6-11	12-17	Public ^e	Private	Public ^e	Private
	2016-2018	2019	2016-2018			2019			2016-2018		2019	
All US children	100	100	32.2%	33.8%	33.9%	32.1%	33.6%	34.3%	35.9%	57.8%	36.8%	63.2%

	All children, age 0-17 years		Child age						Insurance type			
			0-5	6-11	12-17	0-5	6-11	12-17	Public ^e	Private	Public ^e	Private
	2016-2018	2019	2016-2018			2019			2016-2018		2019	
Adverse Childhood Experiences (ACEs): Exposed to two or more household level ACEs ^b	13.2%	13.5%	6.2%	14.4%	18.6%	5.9%	14.0%	20.1%	22.1%	7.7%	23.7%	7.7%
Parental Mental Health: One or two caregivers reported poor or fair mental health ^c	7.3%	8.0%	6.5%	7.5%	7.8%	8.0%	8.0%	7.9%	10.8%	5.1%	12.3%	5.2%
Parental Aggravation: Child's caregiver usually/always felt aggravated with child ^d	4.9%	5.1%	3.5%	5.2%	5.9%	4.0%	5.1%	6.0%	7.1%	3.6%	7.3%	3.6%
Parent Coping/Support: Child's caregiver is not coping well and/or lacks emotional support for parenting	24.9%	25.0%	19.7%	26.1%	28.7%	20.2%	26.5%	28.0%	33.7%	17.1%	33.8%	17.5%

^a“Economic hardship” item wording changed in 2018 resulting to decrease the prevalence of children whose family experienced economic hardship (25.4% in 2016, 23.0% in 2017, 15.5% in 2018 and 15.4% in 2019). See Appendix A Part A3 for details.

^bThe adverse childhood experiences (ACEs) measure used in this study only includes topics aligned with the original CDC/Kaiser study on ACEs: witnessed violence in home, loss of caregiver due to death, divorce/separation, incarceration, household alcohol or drug abuse or serious depression, suicidality, mental illness.

^cChild had one or two caregivers reporting poor or fair overall mental health status.

^dChild's caregiver reported that they usually/always felt the child is difficult to care for, does things that bother them, or is angry with child.

^eIncludes children with any public health insurance, even if they also had some form of private insurance as well.
